EXPLORING VISIONS OF OUR ENERGY FUTURE

Employing a full spectrum of disciplines, including important insights from the arts and humanities, the Energy Humanities projects in FES inquire into the complex intersections of climate change and energy transition to model a range of low-carbon just futures. The potential for any technology to have impact relies on its social and political reception for commercial and industrial uptake. Focusing on the social and political components of energy transition from public opinion to global policy, these projects demonstrate the critical roles that art, research-creation, and cultural and social analysis play in initiating social change that then drives technology decisions adequate to meet global climate targets.
