MATCH THE WATER FOOTPRINT

Most of us know it takes water to grow our food. But did you know it takes water to make everything from cars to gasoline to blue jeans?

We even need water to run the internet!

Water is used to keep computers cool in data centres around the world. Without water, we couldn't search Google, download a movie, or use artificial intelligence like ChatGPT.

Only about 1.2% of Earth's fresh water can be used in drinking water. But this precious resource is also used to cool computers and make things. It is important to find ways to reduce our water use, so that there is enough for everyone to drink.

Can you match the cards to their correct water footprint?
